Exam slide index

Find a concept, its exact slide PDF, and the page to open. Organized by main topics 1–5, with individual slide decks inside each topic.

All numbers are PDF pages, starting at 1 and including the title slide. They are not necessarily the numbers printed on the slides. For example, PDF page 40 in 1.2 is printed slide 41; PDF page 51 in 1.3 is printed slide 54. Use the PDF reader's page counter. Ranges include repeated reveal slides.

The detailed tables cover the lecture theory and exercises. Lab 4 briefing material has a separate final section. **5.1E** means **5.1. Extra Material.pdf**. Page references link to the local slide files when this index stays in Study Notes; whether a link opens directly at the requested page depends on the PDF reader.

Main topic / detailed index	Index page
1. Learning fundamentals, shallow and Bayesian learning	2
2. Reinforcement learning	4
3. Neural networks and deep learning fundamentals	6
4. CNNs and transfer learning	8
5. Advanced deep learning	9
Lab 4 supplement: deployment, explainability and compression	12

Common calculations and distinctions

Find	Deck: PDF pages
Training / validation / test; cross-validation	**1.1**: 31–32, 41; **1.2**: 21–25
Regression errors; classification metrics / confusion matrix	**1.2**: 40, 60–67
Bayesian posterior / prediction; Gaussian-process equations	**1.3**: 13–14, 51–52
Discounted returns and Bellman equations	**2.2**: 8–19
MC / TD update; SARSA versus Q-learning	**2.3**: 23–24, 29, 35–38
Dense-network dimensions and parameter counts	**3.2**: 39–42; **3.3**: 8–10
Hinge / softmax loss; backpropagation exercise	**3.3**: 23–26; **3.4**: 8–17
Convolution output size, parameters and receptive field	**4.1**: 17, 20–23, 30, 106
Residuals; BN count and train/eval; normalization variants	**4.1**: 52–59, 62
LSTM dimensions, parameter counts and one-step update	**5.1E**: 5–7
Attention calculation, shapes and classroom A/B exercise	**5.2**: 11–13, 42
Causal mask, cross-attention, KV cache and image patches	**5.2**: 31–40
PCA / t-SNE; k-means / topic mixtures	**5.4**: 9–22
Pretraining / SFT / RL; CLIP, DINOv2 and SAM	**5.3**: 14, 19–22
AE / VAE / GAN / diffusion: meanings and comparisons	**5.5**: 7–13, 17–22

1. Learning fundamentals, shallow and Bayesian learning

1.1. Fundamentals.pdf

45 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Machine learning, models, assumptions, inductive bias; No Free Lunch	4–6
Supervised learning; regression versus classification	10–14
Unsupervised learning; dimensionality reduction and clustering	15–17
Reinforcement learning and combinations of learning strategies	18–23
Abstraction, partial information; correlation versus causation	24–26
Data quality, sampling bias, Big Data limitations, feature choice	27–30
Training, validation and test sets; model selection and evaluation	31–32, 41
k-nearest neighbours (k-NN): prediction, distance and choice of k	33–34, 36
k-NN examples: dataset size, splits, digits and image difficulty	37–39
ML workflow: frame problem, explore data, compare and tune models	40–44

1.2. Shallow Learning.pdf

85 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Linear regression, Gaussian noise, likelihood and least squares	4–8
Negative log-likelihood; gradient descent and stochastic updates	9, 26–31
Basis-function expansion; polynomial regression	11–12
Overfitting, bias-variance trade-off and model complexity	13–15
Ridge / L2 regularization; Gaussian prior and MAP interpretation	16–18
Lasso / L1 regularization; sparsity and coefficients set to zero	19–20
Hyperparameters, validation splits and cross-validation	21–25
Learning rate; batch GD versus SGD; mini-batches and momentum	27–32
Other optimization algorithms: overview	33
Outliers; robust regression, L1/Laplace, Huber and RANSAC	34–39
Regression metrics: MAE, MSE, RMSE, median error and R-squared	40
Bayesian ridge and ARD: regression comparison	42
Feature scaling / standardization and its importance	43
Linear classification, decision boundary, perceptron and sigmoid	45–48
Logistic regression: Bernoulli likelihood, cross-entropy and training	49–53
Multiclass / multinomial logistic regression and softmax	54–56
MLP preview; hidden layers and nonlinear activations	57–59
True/false positives and negatives; TP, TN, FP, FN	60
Accuracy, precision and recall: definitions and interpretation	61–62
Classification threshold; precision-recall trade-off and PR curve	63–64
F1 / F-beta; confusion-matrix orientation	65
Read a multiclass confusion matrix; per-class and aggregate metrics	66–67
PCA; dimensionality reduction and its effect on a classifier	68–70
K-means clustering	71
SVM: separating hyperplanes, maximum margin and support vectors	72–75
Soft-margin / non-separable SVM	76
SVM optimization: Lagrange formulation	77
Nonlinear feature maps and the kernel trick	78–79
Classification and regression trees (CART)	81
Ensembles; bootstrap sampling, bagging and random forests	82–83

1.2. Shallow Learning – continued

Concept / method / exercise	PDF pages
Boosting; AdaBoost and gradient boosting	84

1.3. Bayesian Learning.pdf

58 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Bayesian reasoning; prior, likelihood, posterior and Bayes rule	4–6
Bayesian prediction versus ML/MAP point estimates	7–8
Bayesian linear regression; Gaussian prior, likelihood and posterior	9–13
Multivariate Gaussians; covariance, marginals and conditioning	10–12
Posterior predictive distribution; prediction uncertainty	14
Regression in feature space; weight-space versus function-space views	15–20
Polynomial, Fourier, bell, Heaviside and exponential basis functions	21–27
Learned/many features; kernel trick and transition to Gaussian processes	28–30
GP definition, joint distributions, correlation and conditioning	31–35
Nonparametric models; training data versus fixed parameter vectors	36
Kernel families: squared exponential, Matern, linear, periodic, neural	37–43
Combining kernels; linear plus periodic structure	44–45
Kernel hyperparameters: lengthscale, signal variance and noise	46–47
Automatic Relevance Determination (ARD); per-dimension lengthscales	48
Hyperparameter learning; marginal likelihood and complexity/fit trade-off	49–50
GP predictive mean and variance; regression summary equations	51
Cholesky-based GP computation	52
Nonzero means, hierarchical Bayes, non-Gaussian likelihoods and GP extensions	53–56

2. Reinforcement learning

2.1. Introduction to Reinforcement Learning.pdf

16 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
What RL is; agent interaction versus supervised/unsupervised learning	2–3
Rewards, costs and the reward hypothesis	5–6
Agent-environment loop; deterministic/stochastic gridworld	7–9
Partial observation and generalized decision-process introduction	10
Transition/reward model, policy and value function	11–13
Planning with a known model versus learning through interaction	14–16

2.2. Markov decision processes.pdf

26 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Markov property; MDP tuple: states, actions, transitions, rewards, discount	2–3
Racing example and search-tree representation	4–5
Policy: probability of an action given a state	6
Return, discount factor gamma, finite/infinite horizon; discounting quiz	7–10
State value V and action value Q	11
Bellman expectation equations; recursive value evaluation	12–15
Optimal V/Q functions and optimal policy	16–17
Bellman optimality equations; maximization over actions	18–19
Dynamic programming: why the model is required	20
Iterative policy evaluation and stopping criterion	21–22
Value iteration and greedy action selection	23–24

2.3. Q-learning.pdf

48 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
MDP recap and unknown transition/reward models	3–5
Model-based versus model-free learning; passive prediction versus control	6–10
Monte Carlo policy evaluation from complete episodes	11–13
Incremental mean and incremental Monte Carlo update	14–15
MC limitations; bootstrapping and temporal-difference learning	16–20
Constant learning rates and forgetting old observations	21
MC versus TD versus dynamic programming; update equations	22–26
Monte Carlo value-update formula	23
TD(0) value update and TD error	24
Control and Q-values; greedy action selection without a transition model	27–28
SARSA update: sampled next action	29
Exploration versus exploitation; epsilon-greedy and regret	30–33
Q-learning target, update formula and algorithm	34–36
On-policy versus off-policy; SARSA versus Q-learning	37–38
Large state spaces, features and linear value-function approximation	39–42
Approximate Q-learning; TD-error-based weight updates	43–44
Worked Pacman feature/Q-value/weight-update example	45
Online least squares / gradient interpretation	46

2.3. Q-learning – continued

Concept / method / exercise	PDF pages
Deadly triad: function approximation, bootstrapping and off-policy learning	47

2.4. Policy Search.pdf

19 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Policy-based versus value-based RL; advantages and limitations	2–3
Trajectory probability and its factorization	4–5
Expected-return objective; gradient ascent on policy parameters	6–7
Policy-gradient derivation and sampled update	8–10
Softmax policy over action scores	11
Automatic differentiation and REINFORCE; return-weighted log probability	12–15
Actor-critic: actor policy, critic value/Q estimate	16–17
Local/global policy optimization; gradient-free alternatives	18–19

3. Neural networks and deep learning fundamentals

3.1. Introduction to Deep Learning.pdf

41 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
AI, ML and deep learning; what deep learning means	6–10
Application examples: language, vision, control, science and engineering	11–25
Deep learning and Big Data; opportunities and limitations	26–29
DL pipeline, learning methodology and overfitting	30–32, 36–37
Collecting and labeling data; coverage, classes and variability	33–35
Handcrafted versus learned features; representation learning	38–39

3.2. Shallow NN.pdf

51 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Linear regression versus a shallow neural-network model	4–6
ReLU activation; example network and its ten parameters	7–9
Hidden-unit construction; weighted sums and piecewise-linear output	10–17
Activation patterns / active hidden units	18
Network diagrams, weights and hidden width	19–22
Universal approximation theorem	23–24
Multiple outputs; shared hidden representation and output-specific weights	26–28
Multiple inputs; activation boundaries and regions in 2D	30–37
General input/hidden/output dimensions; parameter-count exercise	39–42
Number of linear regions; dependence on input dimension and hidden width	44–47
Terminology: layers, units, biases and weights	49–50
Alternative activation functions	51

3.3. Deep Learning Fundamentals.pdf

44 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Neuron/perceptron recap; composition of nonlinear layers	3–7
Depth, width, matrix formulation and deep-network parameter shapes	8–11
Shallow versus deep capacity; depth efficiency and linear regions	12–14
Scores / logits; mapping inputs to class scores	16–21
Loss functions; multiclass SVM / hinge loss	22–23
Softmax cross-entropy; score/probability interpretation and loss exercise	24–26
Choosing a task loss; adding regularization	27–28
Optimization, gradient descent, SGD and mini-batch noise	29–35
Local minima, saddle points and optimization difficulties	31, 36
Momentum and optimizer variants	37–39
Adam: moment estimates, normalization and bias correction	40–42
Parameters, hyperparameters and the training pipeline	43–44

3.4. Deep Learning Fundamentals II.pdf

53 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Forward pass, backward pass, gradients and chain rule	3–7
Scalar backpropagation examples and classroom exercise	8–17
Computation graphs; local backward operations and autograd	18–22
Input normalization; random initialization, He and gradient scale	23–25
Generalization gap; explicit L2 regularization / weight decay	26–29
Implicit regularization; SGD and early stopping	30–31
Dropout; randomly disabling hidden units during training	32, 34
More data, noise and label-preserving data augmentation	33–35
Capacity, generalization and double descent	36–38
Hyperparameter choices and overall training recipe	39–42
Matrix derivatives; forward and backward propagation through layers	44–48
ReLU derivative	49–50
Gradients with respect to weights and biases	51–52
Backpropagation: efficiency and limitations	53

4. CNNs and transfer learning

4.1. CNNs.pdf

111 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Image structure; local connectivity, weight sharing and convolutional features	4–11
One-dimensional convolution and filter sliding	12–14
Kernel, stride, padding, dilation; output-size formula and questions	15–18
Feature maps/channels and receptive fields	19–23
2D/RGB convolution; input/output channels and parameter counts	24–30
Downsampling, pooling and strided convolution	31–32
Upsampling, interpolation, unpooling and transposed convolution	33–35
1-by-1 / pointwise convolution; mixing channels	36
AlexNet, DeConvNet and feature-map visualization	37–43
VGG; small filters, depth and receptive-field comparison	44–47
Activation memory, batch size and deeper architectures	48–50
Vanishing gradients; ResNet, identity shortcuts and bottleneck blocks	51–54
Batch normalization: statistics, gamma/beta and parameter count	55–56
BN training versus inference; running statistics, eval mode and folding	57
Why normalization helps; batch/layer/instance/group normalization	58–59
ResNet family; addition versus concatenation; residual/BN quick questions	60–62
Inception/GoogLeNet and DenseNet modules	63
MobileNet depthwise-separable convolution; EfficientNet scaling	64
Vision Transformer / ConvNeXt comparison and architecture trends	65–66
Transfer learning and frozen feature extraction	67–70
Fine-tuning; dataset size/domain similarity and adaptation choices	71–74
Initial loss, overfitting a tiny set, learning curves, learning-rate decay	75–81
Detection, box regression, Faster R-CNN and YOLO	82–86
PoseNet; position/orientation regression	87–88
Semantic segmentation, FCN, SegNet and instance segmentation/Mask R-CNN	90–93
Video feature fusion, multimodal inputs and temporal-order limitations	94–101
Task summary; 1D/2D/3D engineering applications and simulation surrogates	102–105
Classroom calculation: feature-map sizes and convolution parameters	106
Lab 3 connection: toy CNNs and pretrained-model fine-tuning	108–110

5. Advanced deep learning

5.1. Sequence Models.pdf

34 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Sequential order, variable lengths, recurrence and shared weights	3–6
Vanilla RNN equations; hidden state and character-level predictions	7–9
Generated sequences and interpretable recurrent units	10–12
Backpropagation through time (BPTT); vanishing/exploding gradients	13–15
Truncated BPTT; memory cost and long-range gradient limitations	14, 16
Gradient clipping, initialization and architectural remedies	16
LSTM cell/hidden states; forget, input, candidate and output gates	17–20
Additive memory path; GRU and its gates	21
Stacked and bidirectional recurrent networks	22
Video action recognition and dense captioning	23–24
Temporal convolutional networks (TCN); causal/dilated filters; WaveNet	25–27
Recurrent seq2seq encoder-decoder; fixed context vector	28
Teacher forcing, inference feedback, exposure bias and scheduled sampling	29
Attention over encoder states; captioning with attention	30–31
Summary equations: RNN, BPTT, LSTM, seq2seq and attention	32
Character-RNN practical exercise	33

5.1. Extra Material.pdf

7 PDF pages. Separate PDF; lookup code 5.1E. Open this slide PDF.

Concept / method / exercise	PDF pages
LSTM cell diagrams and gates	2–4
Tiny LSTM: matrix dimensions, vocabulary, hidden width and parameter counts	5
Learned parameters versus computed states; changing vocabulary or hidden width	6
Worked LSTM update: gates, cell/hidden state and next-character scores	7

5.2. Transformers.pdf

43 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
RNN/CNN/attention comparison; weighted context and query/key/value intuition	3–8
Self-attention: value projections, query-key scores and softmax weights	9–10
Numerical attention example; shared parameters versus input-dependent weights	11
Matrix attention, tensor shapes, row softmax and square-root scaling	12–14
Permutation equivariance / order blindness; need for positional information	15
Sinusoidal, learned, relative, rotary (RoPE) and ALiBi positions	16–17
Encoder-only, decoder-only and encoder-decoder overview	18
Tokenization: words, characters, subwords and BPE	19
Token embeddings, embedding table and contextual representations	20–22
Transformer block and multi-head attention; concatenate and project	23–24
Residual connections; Add & Norm and layer normalization	25, 27
Positionwise feed-forward MLP	26
Encoder stack, masked language modeling and CLS readout	28–29
Autoregressive factorization; next-token cross-entropy and training parallelism	30
Causal mask; future-token leakage and zero attention to forbidden positions	31

5.2. Transformers – continued

Concept / method / exercise	PDF pages
Self-attention versus cross-attention; three transformer families	32–35
Quadratic attention cost; KV cache, FlashAttention and grouped-query attention	36
Vision Transformers: patches, projection, positions, CLS and hybrid designs	37–40
A/B classroom attention exercise; simplified divide-by-three normalization	41–42

5.3. Foundation models.pdf

28 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Transformer-family recap; encoder, decoder and cross-attention	5–8
Foundation-model definition; broad pretraining and downstream transfer	9–11
Scale, data, hardware; total versus active MoE parameters; shared biases	12–13
Training stages: self-supervised pretraining, SFT, preference RL, verifiable RL	14
BERT: masked-token and next-sentence pretraining examples	15
GPT-style generation and multimodal model examples; post-training	16–17
CLIP: image-text embeddings, contrastive alignment and zero-shot classification	19–20
DINOv2: self-distillation, visual features and downstream transfer	21
SAM: promptable segmentation	22
Text-conditioned image generation; text encoder, denoiser and VAE decoder	23–25
Efficiency, explainability and fairness questions	26

5.4. Unsupervised learning.pdf

38 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Supervision strategies; unlabeled data and semi-supervised learning	2–7
When unlabeled data helps: distribution relevance	7
PCA: variance, projection, compression and retained components	9–11
t-SNE: local neighborhoods, perplexity and visualization pitfalls	12–18
Visualizing high-dimensional CNN features	17–18
K-means: initialization, assignments and centroid updates	19–20
Hierarchical clustering: agglomerative versus divisive	21
Latent Dirichlet Allocation (LDA); topic mixtures, not discriminant analysis	22
Self-supervised pretraining and proxy/pretext tasks	24–27
Patch position, jigsaws, colorization and inpainting examples	26–27
Contrastive learning; positive/negative pairs and triplet ideas	28–29
BYOL: online/target networks and learning without negative pairs	30–31
SuperPoint: self-supervised keypoint detection and description	32
Semi-supervised teacher-student learning, memory banks and pixel-level contrast	33
Connection to foundation models; PCA versus t-SNE summary	34–36

5.5. Generative Models.pdf

26 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Discriminative versus generative modeling; learning a data distribution	3–6
Autoencoder: encoder, latent code, decoder and reconstruction	7
AE versus VAE; latent distributions, reconstruction plus KL regularization	8
GANs: generator/discriminator roles and adversarial training	9–12

5.5. Generative Models – continued

Concept / method / exercise	PDF pages
GAN instability, weak gradients and mode collapse	13
CycleGAN: unpaired translation and cycle consistency	14
Image editing/style-transfer applications	15–16
Forward diffusion: progressive Gaussian noising	17
Learned reverse diffusion; denoising training versus sampling	18–19
Conditional / latent diffusion; text representations and image decoding	5, 20–21
AE/VAE/GAN/diffusion comparison: objective, stability, speed, quality, latent space	22
Course map: AI, ML, neural networks, deep learning and application areas	25–26

Lab 4 supplement: deployment, explainability and compression

manolo_presentation.pdf (Lab Sessions / Lab4)

15 PDF pages. Open this slide PDF.

Concept / method / exercise	PDF pages
Explainable AI (XAI) and model compression: definitions	2
AI governance / regulatory context discussed in the briefing	3–4
Trustworthiness, fairness, transparency and robustness	5
Edge deployment: latency, memory, compute, energy and privacy	6
Grad-CAM: class-specific image evidence and heatmaps	7
Compression families: quantization, pruning, distillation and low-rank methods	8
FP32 versus INT8 quantization; memory reduction and accuracy trade-off	9
Magnitude pruning, sparsity, fine-tuning and hardware-dependent speed	10
Compare accuracy and explanations before/after compression	11
Lab notebook workflow and evaluation tasks	12
